Abstract

To introduce a method for calculating the graphene monoxide(GMO) optical properties. Dielectric function of GMO is calculated using a self-consistent-field Markovian master equation formalism(SCF-MMFE). In here, to employ this method to calculate the dielectric function, complex conductivity, also to obtain plasmon dispersion and propagation length for substrate. GMO is considered by SiO_2 and hBN substrates. Calculating is shown dielectric function and plasmon dispersion what describe GMO optical properties.
